Coastal Navigation Portfolio Management

Advance **objective**, **quantitative**, and **systems-based** approaches to management of the Corps' large coastal navigation portfolio of projects.

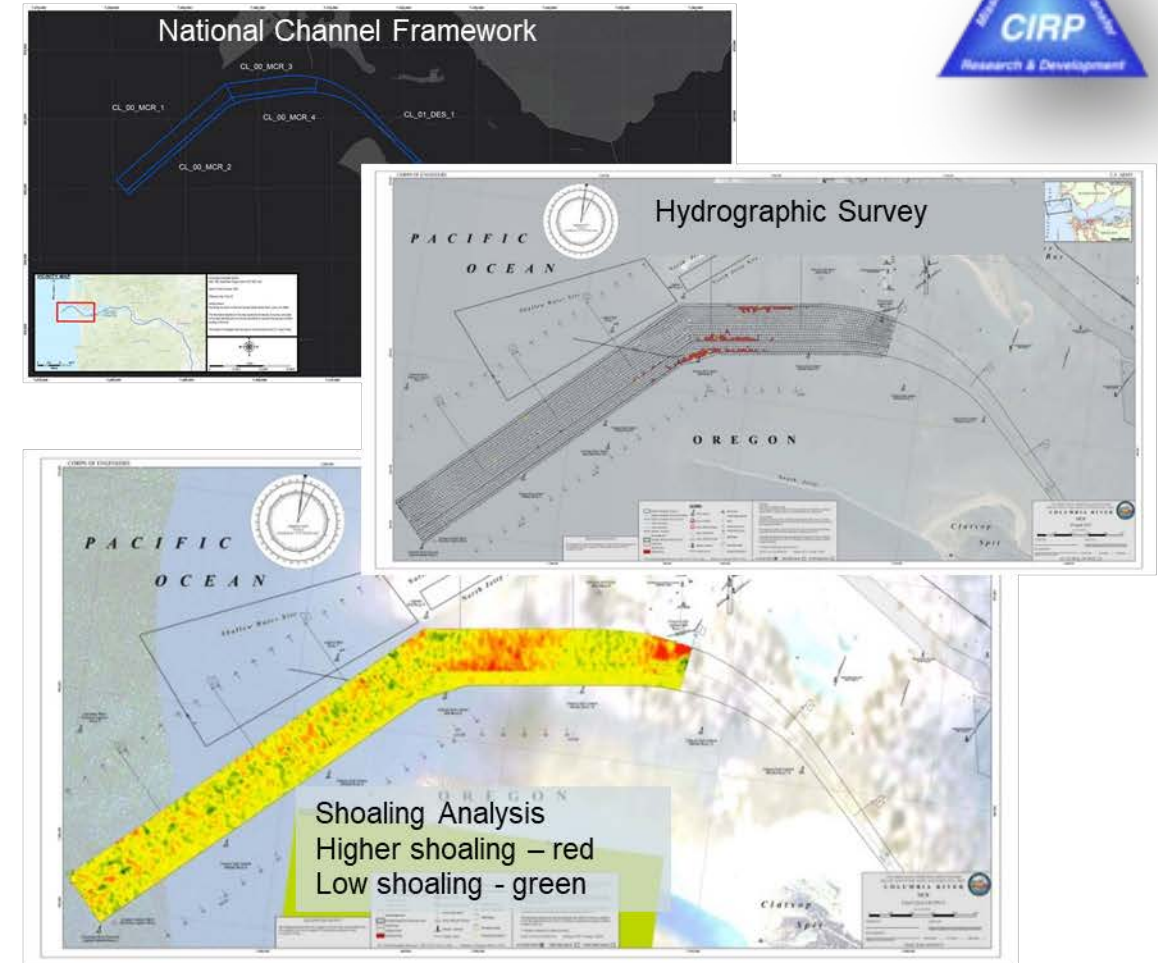

Corps Shoaling Analysis Tool (CSAT)

Description

- CSAT estimates shoaling rates using hydrographic surveys within the boundary of the National Channel Framework.
- CSAT uses the historical shoaling rates to predict future dredging volumes at various channel depth intervals.
- Where are shoaling 'hot spots' within the navigation channel?
- How has shoaling changed as a result of meteorological events (extratropical storm, rainfall or drought periods), dredge schedule change or dredge type change?

National Channel Framework, hydrographic survey map sheet from eHydro, and the shoaling rate prediction for Columbia River, OR.

High : 5
Low : -5
0 0.1 0.2 Miles

Shoaling Analysis on 10ft x 10ft grid

- Analysis on 10' x 10' grid
 - Elevations
 - Avg/max/min shoaling rates

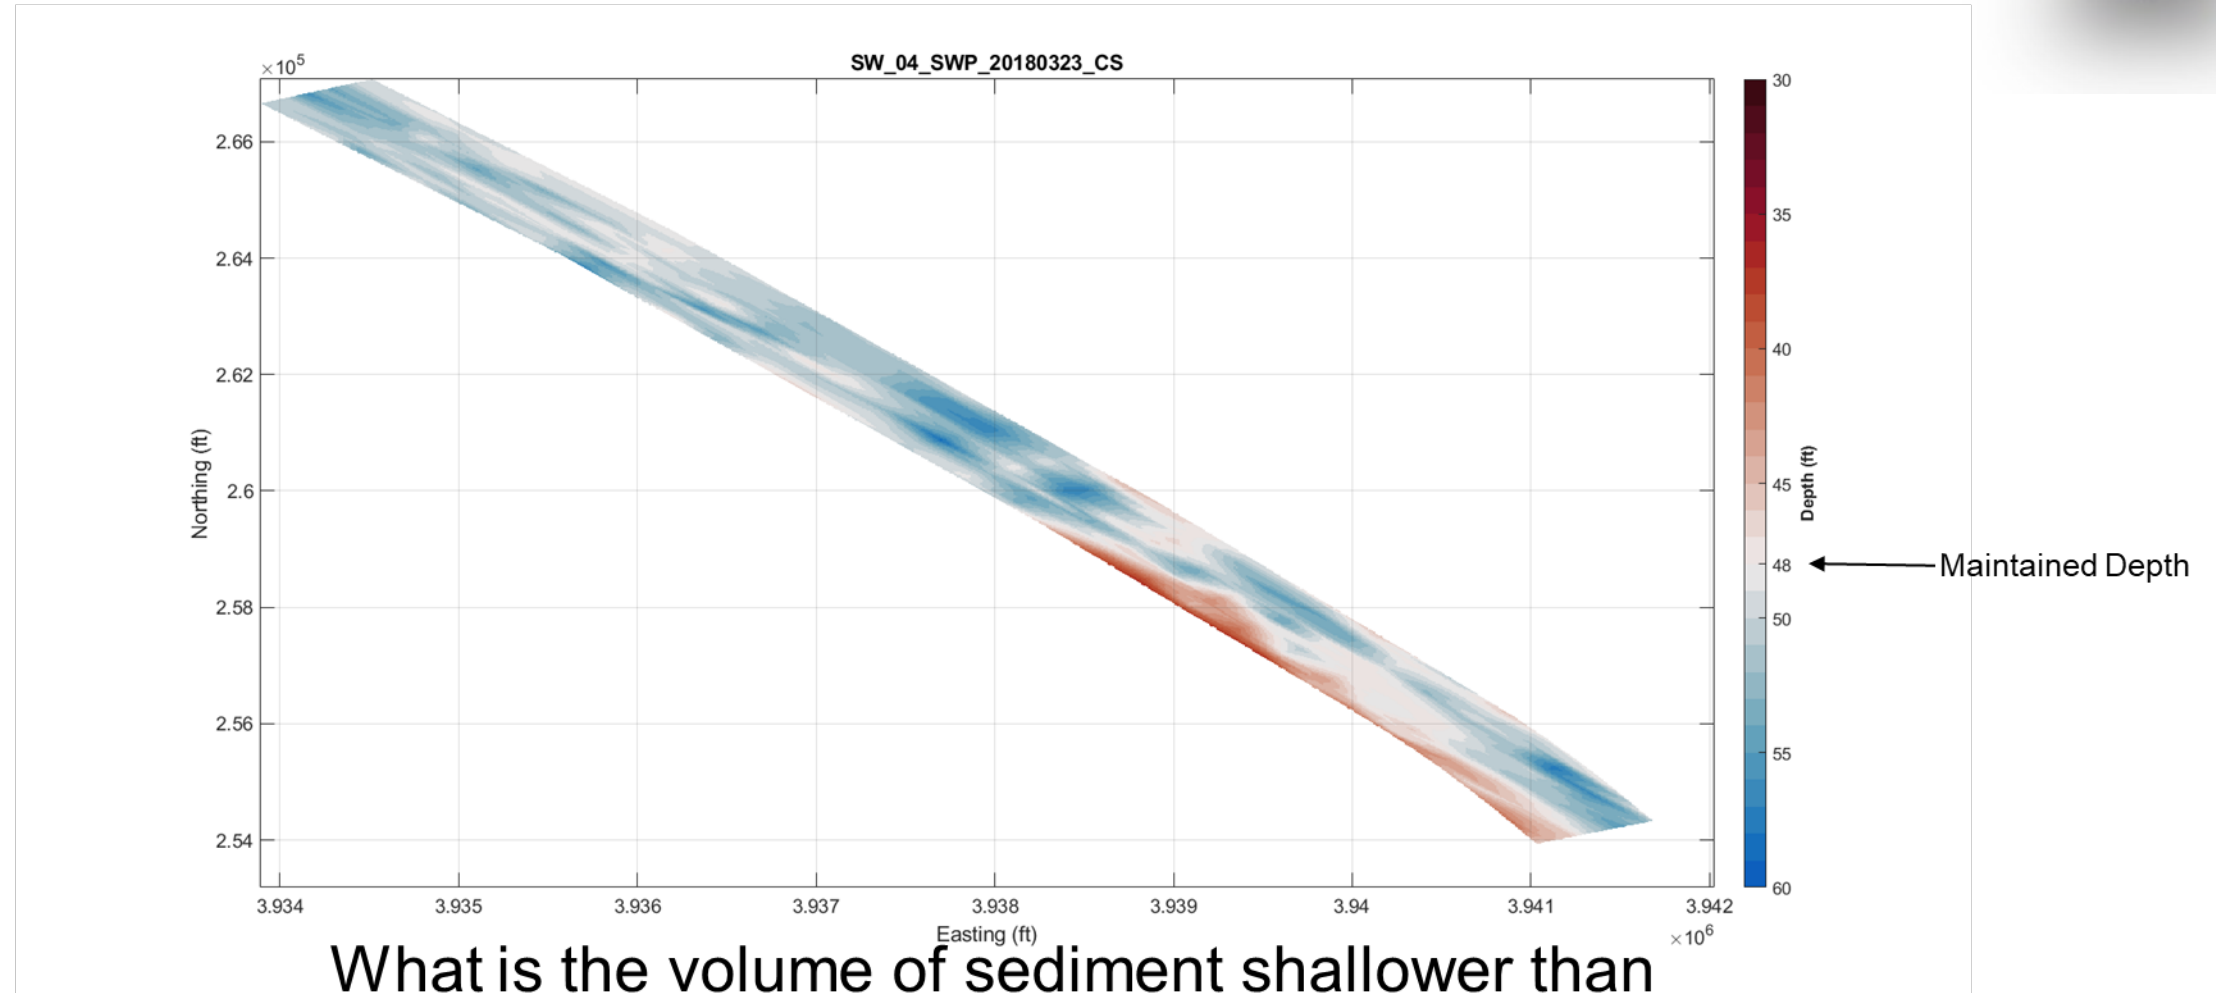

So What's New?

- **New CSAT Product**
 - Example application of CSAT shoaling forecast
- **New Animations from eHydro data**
- **Improvements of Channel Availability**

Survey Planning Quantities (SPQ)

CSAT Output – Reach Level or CWIS level Rollup – Volume Tables

- Report volumes at different depth/time intervals and shoaling rates

New approach for defining channel availability

How good of a job are we doing maintaining our channels? Historically evaluated using “channel availability”.

Controlling Depth is the minimum depth in a channel quarter

Currently testing Controlling Depth vs Project Depth:

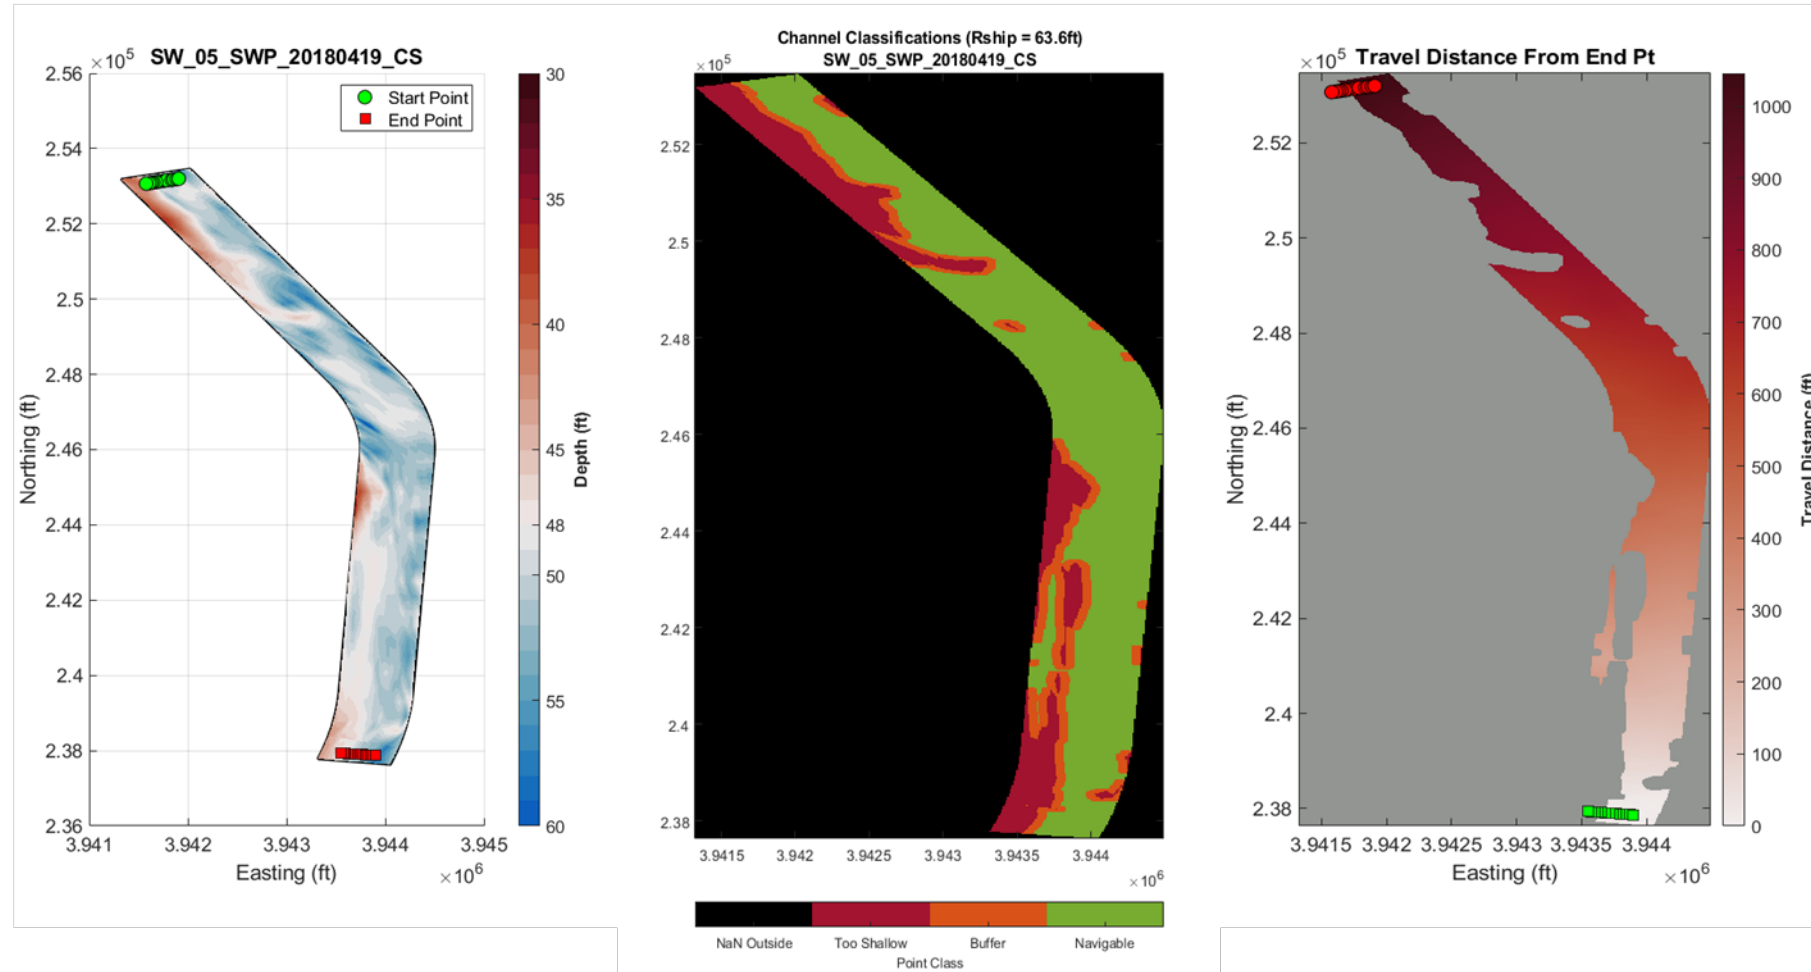

```
if controllingDepth < projectDepth
    channelAvailable = false;
else
    channelAvailable = true;
end
```

This definition means that it is possible for a single survey point to declare the entire channel as unavailable. Does that single point actually impact the vessel traffic though?

Channel Navigability

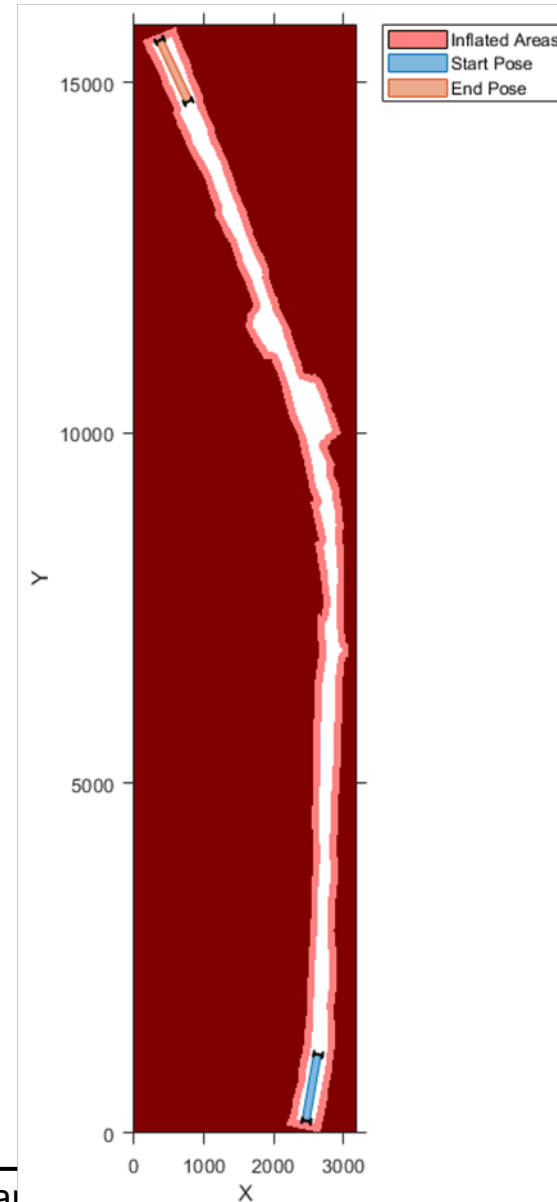

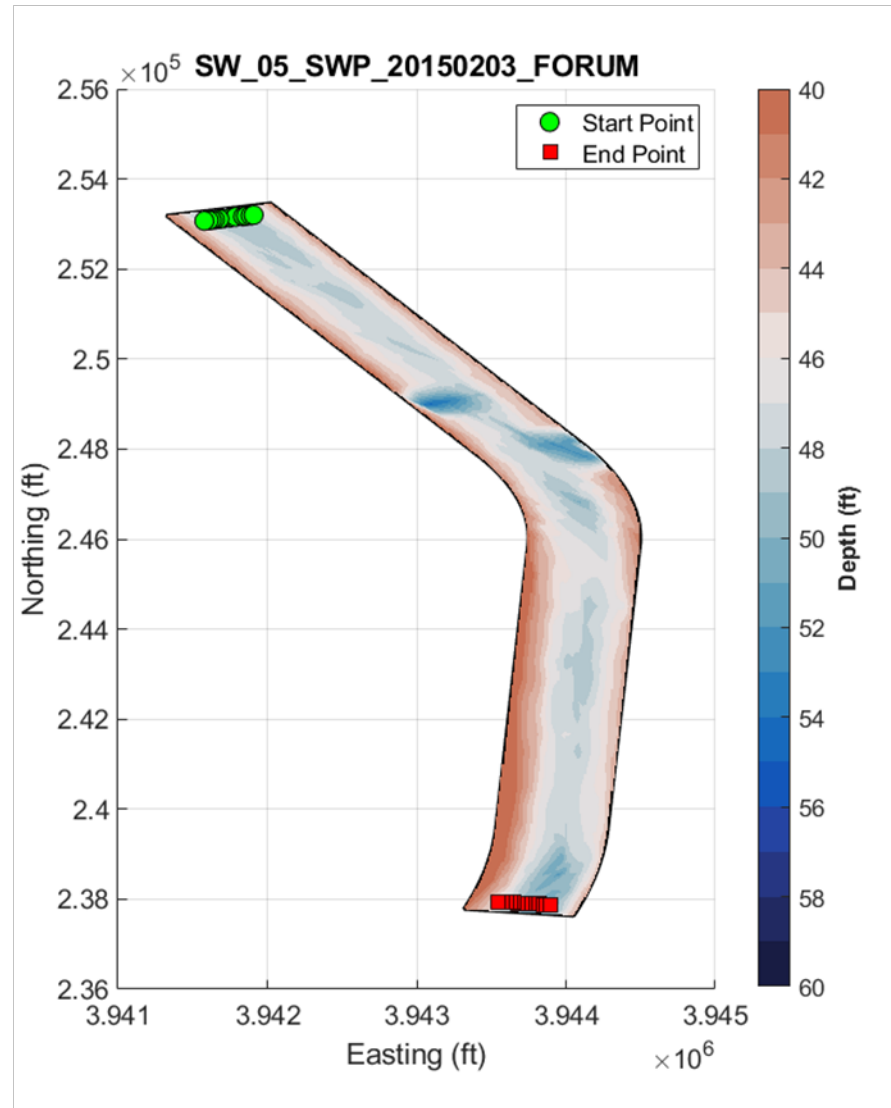

Channel Navigability

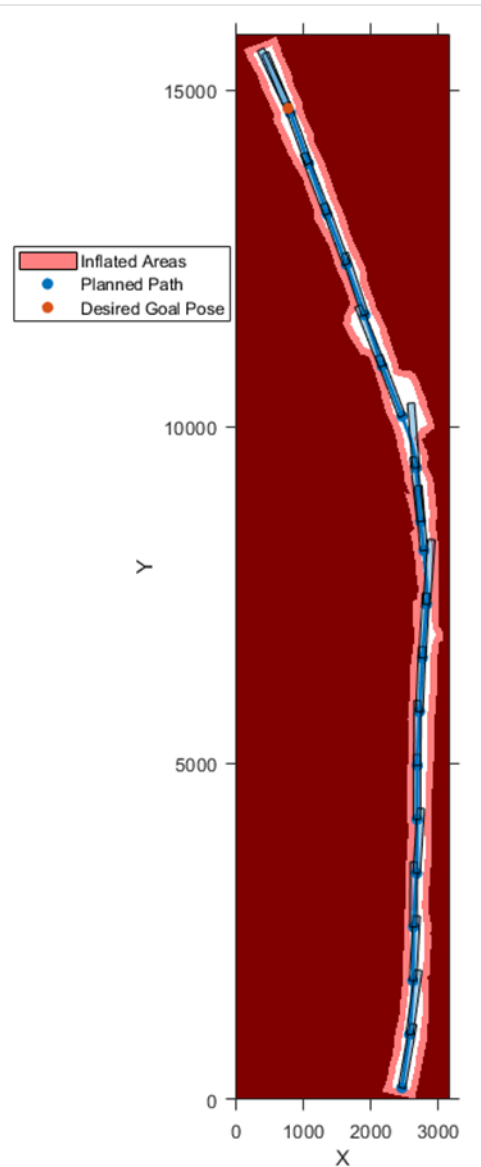

- **Representative Vessel**
 - **Panamax**
 - ▶ **Length: 965 ft**
 - ▶ **Beam: 106 ft**

Other items in the menu include CMS, SMS, Bouss 2D, CPT, CSMART, GenCade, CS Inlet Engineering Tools, Inlet Reservoir Model, Sediment Budget Tools, Sediment Mobility Tool, WaveNet & TideNet, and CIRP Portal. The background shows the 'US Army Corps of Engineers' logo and a 'Coming Events' section with a webinar on September 20, 2019.

Corps Shoaling Analysis Tool (CSAT), version 1.02

Updated 8 March 2019

The CSAT calculates channel shoaling volumes using historical channel surveys and uses the shoaling rates to predict future dredging volumes. Shoaling rate grids can be used to identify hot spots or areas of increased sedimentation. The volume tables that quantify the amount of sediment needing to be dredged at depth and time increments also support decision making that will maximize the use of dredging funds and minimize disruption to vessel traffic through the navigation channels. CSAT is run using a Matlab executable file and requires survey upload through eHydro for the channel. CSAT is being developed jointly by CIRP and the Asset Management (AM) program.

System Requirements for use of website: (**Note - this requires Administrator privileges for installation)

For Installation instructions, choose machine type below.

CorpsNet Users

Connect to internet for Matlab runtime installation

CorpsNet users without MATLAB should request via ACE-IT app portal

- Go to <https://app-portal.usace.army.mil/esd/Home>

- Search for Matlab Runtime and select MathWorks MATLAB Runtime R2017a 9.2

After Install, download zip file from [here](#)

Input and Output files are available for download here: <https://rdedrivepub.erdc.dren.mil/url/csat>

FY19 Technical Report

[Corps Shoaling Analysis Tool: Predicting Channel Shoaling](#) **NEW**

Future Work

- **Continue improving Routing**
 - Apply in other locations
- **CSAT in Python (beta testing)**
- **CSAT on Microsoft Azure**
 - (migration of production process almost complete)
